## **SUPERVISOR'S CERTIFICATE**

This is to certify that the thesis entitled “Language in Clinical Reasoning: Learning and using the language of collective clinical decision making” submitted by Stephen Loftus in fulfilment of the requirements for the degree of Doctor of Philosophy is in a form ready for examination.

Professor Joy Higgs  
School of Physiotherapy  
University of Sydney  
March 2006

## **CANDIDATE'S CERTIFICATE**

I, Stephen Loftus, hereby declare that the work contained within this thesis is my own and had not been submitted to any other university or institution as a part or a whole requirement for any higher degree.

Stephen Loftus

March 2006

## ACKNOWLEDGEMENTS

There are a number of people without whom this thesis would not have been possible. Firstly, I would like to acknowledge all the participants, both in the medical school and the multidisciplinary clinic. They were all busy people, and they were very generous in giving up some of their time to be interviewed, and sharing their experiences and their insights with me. The research interviews were not only informative, but enjoyable. Professor Michael Field, the Associate Dean of the Northern Clinical School of the University of Sydney, not only allowed me to interview his students, but was helpful in selecting a PBL group that he, and his support staff, felt were typically representative. Professor Michael Cousins, Director of the Pain Management Research Institute, was equally cooperative in permitting me to approach the health professionals working in his clinic.

I would like to acknowledge the support and encouragement of my great friend, and much missed former colleague, Isobel Taylor. Isobel introduced me to the notion of qualitative research, at first a wholly alien concept for me. My first supervisor in the Faculty of Education, Kate Crawford, introduced me to the fascinating world of Vygotsky. Professor Michael Cole, of the University of California in San Diego, is well-known for being one of the people largely responsible for introducing Vygotsky to the Western world. Professor Cole was extremely generous in allowing me to spend a day with him, patiently answering my questions about Vygotsky and the world of cultural psychology, and encouraging my interest in the “linguistic turn” in the human sciences. Following our conversation I paid a visit to the UCSD book store and began reading about the world of metaphor. Professor Trish Greenhalgh, of the University of London, was also kind enough to see me and answer all my questions about narrative. My associate supervisor, Dr Rodd Rothwell, a philosopher and Vygotsky scholar, has been most helpful with his insightful and thought-provoking comments. Ms Joan Rosenthal has been an excellent proof reader and guide through the fine detail of academic writing.

An especial thanks must go to my main supervisor, Professor Joy Higgs, who has been a great mentor as well as a steady source of encouragement. She introduced me to the world of hermeneutics and phenomenology. Joy is very much a hands-on supervisor and for that I am grateful. All that red ink was unnerving at first, but I quickly learned to

appreciate its value, and soon realised that I was privileged to be receiving the personal attention of one of the world's great teachers. Thanks must also go to Joy's group of research students, too numerous to mention individually, they were a great source of encouragement.

Last, but not least, I must acknowledge my family, *sine qua non*. My three daughters, and especially my wife, Beate, have been very tolerant and understanding over the last few years and a constant source of support and encouragement. If the University of Sydney permitted candidates to dedicate theses, then this one would be dedicated to Beate.

## ABSTRACT

The aim of the research presented in this thesis was to come to a deeper understanding of clinical decision making from within the interpretive paradigm. The project draws on ideas from a number of schools of thought which have the common emphasis that the interpretive use of language is at the core of all human activity. This research project studied settings where health professionals and medical students engage in clinical decision making in groups. Settings included medical students participating in problem-based learning tutorials and a team of health professionals working in a multidisciplinary clinic. An underlying assumption of this project was that in such group settings, where health professionals are required to articulate their clinical reasoning for each other, the individuals involved are likely to have insights that could reveal the nature of clinical decision making. Another important assumption of this research is that human activities, such as clinical reasoning, take place in cultural contexts, are mediated by language and other symbol systems, and can be best understood when investigated in their historical development.

Data were gathered by interviews of medical students and health professionals working in the two settings, and by non-participant observation. Data analysis and interpretation revealed that clinical decision making is primarily a social and linguistic skill, acquired by participating in communities of practice called health professions. These communities of practice have their own subculture including the language game called clinical decision making which includes an interpretive repertoire of specific language tools and skills. New participants to the profession must come to embody these skills under the guidance of more capable members of the profession, and do so by working through many cases. The interpretive repertoire that health professionals need to master includes skills with words, categories, metaphors, heuristics, narratives, rituals, rhetoric, and hermeneutics. All these skills need to be coordinated, both in constructing a diagnosis and management plan and in communicating clinical decisions to other people, in a manner that can be judged as intelligible, legitimate, persuasive, and carrying the moral authority for subsequent action.
