Copyright in relation to this thesis

Under the Copyright Act 1968 (several provisions of which are referred to below), this thesis must be used only under the normal conditions of scholarly fair dealing for the purposes of research, criticism or review. In particular no results or conclusions should be extracted from it, nor should it be copied or closely paraphrased in whole or in part without the written consent of the author. Proper written acknowledgement should be made for any assistance obtained from this thesis.

Under Section 35(2) of the Copyright Act 1968 'the author of a literary, dramatic, musical or artistic work is the owner of any copyright subsisting in the work'. By virtue of Section 32(1) copyright 'subsists in an original literary, dramatic, musical or artistic work that is unpublished' and of which the author was an Australian citizen, an Australian protected person or a person resident in Australia.

The Act, by Section 36(1) provides: 'Subject to this Act, the copyright in a literary, dramatic, musical or artistic work is infringed by a person not being the owner of the copyright and without the licence of the owner of the copyright, does in Australia, or authorises the doing in Australia of, any act comprised in the copyright'.

Section 31(1)(a)(i) provides that copyright includes the exclusive right to 'reproduce the work in a material form'. Thus, copyright is infringed by a person who, not being the owner of the copyright and without the licence of the owner of the copyright, reproduces or authorises the reproduction of a work, or of more than a reasonable part of the work, in a material form, unless the reproduction is a 'fair dealing' with the work 'for the purpose of research or study' as further defined in Sections 40 and 41 of the Act.

Section 51(2) provides that 'Where a manuscript, or a copy, of a thesis or other similar literary work that has not been published is kept in a library of a university or other similar institution or in an archives, the copyright in the thesis or other work is not infringed by the making of a copy of the thesis or other work by or on behalf of the officer in charge of the library or archives if the copy is supplied to a person who satisfies an authorized officer of the library or archives that he requires the copy for the purpose of research or study'.

ACKNOWLEDGEMENTS

• I would like to warmly acknowledge the efforts of the subjects of this study: their forbearance with a stranger who requested of them three hours of hard work.

• I thank my supervisors: Dr. Joel Michell for his numberless skills and infinite calm; Dr. Alan Craddock for his support and advice; and Professor Helen Beh for her timely involvement.

• There isn't a point size large enough to thank Noel Hunt for his skill in writing computer programmes to randomise the items of the Spiritual Orientation Survey, to create the diagrams within, and for teaching me enough to write this thesis on computer.

• I thank John Sutton for his relentless enthusiasm in assembling, critiquing and proof-reading the thesis.

• I thank Shirley Wyver for her support on rainy days collecting data in the far-flung communities, and for her proof-reading; Elizabeth Wilson for her counsel on format style; John Holden for his trouble-shooting ability with UNIX*.

• I thank John Maze for his incisive commentary and lay responsibility for footnote 20 at his feet.

• I thank Dr. Peter White for informative discussions in the early stages of the work.

• I thank Maeve Doyle and Cindy Allison for offering their interviewing skills in the pilot studies.

• I thank Robert and Nancy.
ABSTRACT

This study considers the adequacy of explanatory accounts of recruitment to New Religious Movements [NRMs], defined by their doctrinal innovation or importation from another culture, and formed around a charismatic leader. It considers the coercive persuasion paradigm which assumes no predisposing features of those who become involved, a sociological account by Snow Zurcher and Ekland-Olsen (1980) which seeks to redress overly exclusive attention to psychological variables by emphasising the importance of structural variables such as the existence of 'discretionary time' and having a friend involved in the NRM. It is suggested that a psychological focus need not entail a deemphasis of current life circumstances, such as social bonds, and life stress, nor a failure to acknowledge the importance of the group’s ideology in lending definition to felt difficulties.

The historical lineage of a model of personal change is traced, termed the Rites de Passage model, based on Van Gennep’s (1908) anthropological work, the work of Schein (1957) and Lifton (1961) which leads to the viewing of conversion as an example of resocialisation. Specific focus is placed on the early phases of this process where disruption occurs in existing coping techniques and social supports as a result of disruptive life events. Lofland and Stark's (1965) model forms the conceptual framework from which literature regarding differences in life stress, social bonds and behavioural involvement in NRMs, and prior cognitive spiritual orientation can be addressed.
The work of Galanter (1980, 1989) and Barker (1981, 1984), Heirich (1977) and Snow and Phillips (1980) provides substantial evidence for the existence of pre-existing differences between affiliates (who make contact with such movements) and non-affiliates (who do not). In this thesis two facets of differential involvement are addressed: i) why does one individual rather than another become involved ii) with a given genre of movement rather than another? The *Rites de Passage* model, which is a modified version of Lofland and Stark’s (1965) account of cult conversion, is tested placing NRMs in a comparative context with a secular self-help agency: a therapy group. Four groups of affiliates to three different eastern NRMs are compared to a therapy group, (Richardson and Kilbourne, 1984), two control groups (a student sample, and a sample from the general population) and a western NRM. There are 160 subjects overall, who completed a battery of questionnaires at point of first contact with the movement, to distinguish the precursors for movement involvement from the *sequelae*. Exceptions to this prospective data collection were the western NRM and the inclusion of a graduate rebirthing group. The latter was deliberately included to facilitate pre-involvement and post-involvement comparisons. The former’s adept status was due to the leader’s reluctance to burden new members with a three hour test battery.

Measures were taken regarding life events and their psychological impact using Henderson, Byrne and Ducan-Jones (1981) recent life events inventory and impact scales using a twelve month time frame. A modified version of the Interview Schedule for Social Interaction (by Henderson *et al*, 1981) was used to assess the availability and adequacy of acquaintance-level and intimate bonds in the recent past. Mental health was assessed using Galanter’s (1980) General Wellbeing Scale and
Tellegen’s Multidimensional Personality Questionnaire (1982).

Recollections of early family relations were assessed using Likert scales derived from the detailed comparative study by Ullman (1982) which supported the psychoanalytic hypothesis regarding troubled early parental relations, suggesting that current life difficulties re-evoked early life problems.

Since disruption is seen as a necessary but not sufficient condition for movement involvement (Greil, 1977) the therapy and eastern groups were not expected to differ on the measures so far. Though they were expected to differ, and did differ from the control groups and western NRM members in these respects. The value-added form of the model merely specifies that a substrate of stress and disruption suffered in relative isolation and loneliness will increase the probability that some form of social agency will be sought. This is the first component of differential recruitment, or differential openness as it is termed here.

Differences are predicted and found between the eastern groups on the one hand and therapy group, control groups and western group on the other, when personality variables indicative of a lack of traditionalism, a challenging attitude to conventional authority (assessed by Ray’s (1971) balanced F scale) and a tendency to experience perceptual phenomena indicative of an absorptive or mystical tendency (Tellegen’s MPQ was used to assess this personality feature). The eastern groups have a personality profile of being: unconventional, somewhat impulsive and highly absorptive in perceptual style. This profile distinguished them from all other groups.

When the additional feature of the model was considered, namely the consonance between individual worldview and movement ideology in intensity of spiritual belief
and the eastern or western orientation of that belief (as assessed by a spiritual orientation survey developed by the author across three pilot studies using Coombs Unfolding Technique (Coombs, 1964) to produce a metric ordinal scale), the major finding of the study was that a markedly distinctive feature of those drawn to NRMs is a spiritual orientation consonant with that of the movement approached. The SOS revealed a strongly demarcated pre-existing eastern spiritual orientation in those drawn to make contact with Eastern NRMs, which set them apart significantly from all other groups. The Western NRM, who were already members of their group, had a western spiritual orientation, to the exclusion of an eastern orientation, while the eastern groups were more eclectic. Both eastern and western NRMs were spiritually more intense on the general religious items, suggesting these items are central to any spiritual worldview.

All of the major predictions of the *Rites de Passage* model were supported. The model provides a welcome link between a sociological and psychological focus on movement involvement. The systematic differences between affiliates and non-affiliates of NRMs at point of first contact, suggest that recruitment is unlikely to be completely due to NRM design: the results suggest participants are likely to be interested and consenting.

In summary, it is shown that those drawn to New Religious Movements of an eastern kind are indeed non-traditional, have a high incidence of recent life events and suffer a sense of community isolation, and loneliness which are considered as factors which might lead a person to modify an unfulfilling lifestyle. A portrait of a seeker is lightly (sketched against a background of this dissatisfaction) which includes personality variables like an impulsive, present-oriented pleasure/pain regulatory style, a mystical perceptual style, and an intensity of spiritual orientation and a congruence of spiritual
orientation with that of the ideology of the movement approached. These are considered potential influences on the genre of movement contacted, and are suggested as explanatory of the second facet of differential openness to movement involvement.

The relative privilege of the Western NRM in terms of reduced stress, availability of community and intimate social support suggests that involvement does provide a relief effect, though caution must be exercised in interpreting this difference as these groups differ in membership status and spiritual orientation.

The distress and neediness of those contacting movements for the first time is apparent, which suggests that movement contact might be a response to felt dissatisfaction interpreted within a spiritual worldview. An eastern spiritual worldview is a highly significant distinguishing feature of affiliates, and is the final phase of the Rites de Passage Model. Speculative theoretical consideration of the data's implications for a psycholanalytic consideration of movement involvement, in the light of Cushman (1986), Deutsch (1983), Halperin (1983) Doi (1971) and Kohut's (1977) theory and research is adumbrated concerning differential openness to charismatic appeal.
