UNDERSTANDING STUDENTS LEARNING STATISTICS: AN
ACTIVITY THEORY APPROACH

SUSAN EVE GORDON  B.Sc (Hons), MSc, Dip. Ed., Dip. Datametrics

A thesis submitted to The University of Sydney in fulfilment of the requirements
for the degree of Doctor of Philosophy

FACULTY OF EDUCATION  THE UNIVERSITY OF SYDNEY

March 1998
DEDICATION

I dedicate this thesis to my beloved parents, husband and children

My late father: Rolf Melchiker
My mother: Minnie Melchiker
My husband: Hilton Gordon
My sons: Brian Gordon
           Michael Gordon
ACKNOWLEDGEMENTS

During my long and exciting journey developing this thesis, I enjoyed the support, guidance and company of many people.

Firstly, I wish to acknowledge the help of those I cannot name — the students and academics who are quoted in this thesis. You were generous in sharing your time, feelings and thoughts with me. I have learned so much from you.

I want to thank my supervisor Dr Kathryn Crawford. You encouraged me to think more deeply and creatively than I believed possible. Our discussions were always stimulating and challenging yet never failed to provide the encouragement, support and humour that kept me going. I believe that my thinking blossomed in the nurturing environment that you created.

To the many colleagues and friends who assisted me, my heartfelt gratitude. I am particularly indebted to Mr Peter Fletcher, my co-researcher in the phenomenographic analysis of students’ surveys. Your assistance was invaluable. My thanks to Ms Mary Barnes, my colleague and mentor. Our discussions helped shape my thinking on many topics. Thank you, Mary, too, for your helpful suggestions on portions of this thesis. I also wish to thank Dr Margaret Charles for her support and Professor Heinrich Bauersfeld for his illuminating comments on early drafts of sections of the thesis. I am most grateful for the moral and practical support of my colleagues at the Mathematics Learning Centre: Ms Cathy Kennedy, Dr Collin Phillips and, particularly, Ms Jackie Nicholas, Head of the Centre. Not the least of your help was the strong admonition “to get the thing in”. Thank you, Jackie, for taking on the major task of reading and commenting on a draft of this thesis. I particularly appreciated your chortling your way through chapter five, enjoying the students’ quotes and relating to them.

I spent a fruitful and stimulating semester at the University of Technology, Sydney as part of a Special Study Programme. During this time I participated in many seminars and discussions, which were pertinent to the development of this thesis. I wish to thank my sister, Dr Sandy Schuck, who helped organise my visit to the School of Teacher Education, and made me very welcome, and the many helpful people there, particularly Dr Gilda Segal and Professor Christine Deer.

Last, but not least, I acknowledge the support and love of my family: my sons Brian and Michael, my mother, late father and especially my husband, Hilton. You shared your lives with Vygotsky and a computer for some years. You got used to having conversations with me which ended in silence as you realised that the topic under discussion was not receiving my attention at all. Indeed, I solved many tricky, logical problems while family conversations passed me by. You have all encouraged me with your confidence that a thesis would actually emerge one day and meanwhile you, Hilton, Brian and Michael, did the cooking, shopping and housework at many times. This thesis could not have been written without you.
The following publications and conference papers are related to this thesis.

ABSTRACT

In this project I investigate university students’ orientations to learning statistics. The students who participated in my research were studying statistics as a compulsory component of their psychology course. My central thesis is that learning develops in the relationship between the thinking, feeling and acting person and the social, institutional and cultural contexts surrounding him or her. How students orient themselves or position themselves to learn statistics is reflected in their engagement with the learning task — their activities. These activities determine the quality of their learning and emerging knowledge. To understand student learning I draw on the powerful theories of Vygotsky (1962, 1978) and Leont’ev (1978, 1981). In particular, I extend and apply Leont’ev’s construct of activity (Leont’ev, 1981). This suggests that individuals act in accordance with their purposes and needs which are shaped by and reflect histories and resources, both personal and cultural.

My investigation consists of two studies. Study One is a qualitative exploration of the orientations to learning statistics of five older students. These students sought help with statistics at the Mathematics Learning Centre where I work. My case studies of these students are inseparable from my efforts to help them learn statistics. Study Two is grounded in Study One. The main source of data for this broader study is a survey which was completed by 279 psychology students studying statistics. In keeping with the theoretical framework, my methodology involves a holistic analysis of students and the milieu in which they act. My findings suggest relationships among students’ affective appraisals; their conceptions of statistics; their approaches to learning it; their evaluations and the outcomes of their actions. In Study One the relationships emerged from the students’ descriptions. In Study Two I quantified the ways in which variables related to each other. Structure for the data was provided by means of correlations, factor analysis and cluster analysis. For this study I also interviewed students and teachers of statistics. My data support the systemic view of teaching and learning in context afforded by my theoretical perspective. Learning statistics involves the whole person (Semenov, 1978) and is inseparable from the arena of his or her actions.

The goal of statistics education is surely to enable students to develop useful, meaningful knowledge. My findings suggest that for many of the participants in my project this goal was not being met. Most of these students reported their
reluctance to learn statistics and described adopting primarily surface approaches
to learning it. A range of conceptions of the subject was expressed, but for many
of the students statistical meaning was evidently reduced to performance on
assessment tasks. Such orientations to learning statistics may lead to it becoming
irrelevant and inert information. For a few students, however, the experience of
learning statistics led to self development and enhanced perspectives on the world
in which we live. My project indicates the diversity of students’ experiences. It
raises issues as to why we teach statistics today and how the teaching and learning
of statistics is being supported at university.
