

Vertical Farm

Madrid B8

Founded by Dickson Despommier, skyfarming is a continuously developing concept created as a means to facilitate a radical increase in the world's population by 2050, and simultaneously rejuvenate the 38% of the earth's landmass currently devoted to farming.

This design seeks to take the idea further, revolutionising concepts of transparency in the growth and consumption of local produce. This is effectively portrayed through the creation of transparent flooring, allowing maximum advantage of natural light and simultaneously providing an intriguing user experience. The design encourages users to peer through the revealed structure of the floors and appreciate the towering greenery both above and below.
