Analysis of Some Linear and Nonlinear Time Series Models

Ponnuthurai Ainkaran

A thesis submitted in fulfillment of the requirements for the degree of Master of Science

School of Mathematics and Statistics
University of Sydney

August 2004
Abstract

This thesis considers some linear and nonlinear time series models. In the linear case, the analysis of a large number of short time series generated by a first order autoregressive type model is considered. The conditional and exact maximum likelihood procedures are developed to estimate parameters. Simulation results are presented and compare the bias and the mean square errors of the parameter estimates. In Chapter 3, five important nonlinear models are considered and their time series properties are discussed. The estimating function approach for nonlinear models is developed in detail in Chapter 4 and examples are added to illustrate the theory. A simulation study is carried out to examine the finite sample behavior of these proposed estimates based on the estimating functions.
Acknowledgements

I wish to express my gratitude to my supervisor Dr. Shelton Peiris for guiding me in this field and for his inspiration, encouragement, constant guidance, unfailing politeness and kindness throughout this master’s programme, as well as his great generosity with his time when it came to discussing issues involved in this work. There are also many others whom I list below who deserve my fullest appreciation.

I would like to take this opportunity to thank Professor John Robinson and Dr Marc Raimondo for their guidance in this research during the period in which my supervisor was away from Sydney in 2002.

Associate Professor Robert Mellor of the University of Western Sydney gave me invaluable guidance towards my research on linear time series which appears in Chapter 2 and his help is greatly appreciated.

I am also indebted to Professor A. Thavaneswaran of University of Manitoba, Canada, for giving me the opportunity of working with him on the nonlinear time series described in Chapter 4 of this thesis during his visits to Sydney University.
I owe sincere thanks to the statistics research group for their many helpful discussions and suggestions leading to the improvement of the quality of my research.

The Head and staff of the School of Mathematics and Statistics gave their constant support during my master’s programme, for which I wish to express my gratitude.

I also appreciate the valuable suggestions, comments and proof-reading provided by my friends Chitta Mylvaganam and Jeevanantham Rajeswaran which contributed towards improving the literary quality of this thesis.

I am also indebted to my parents, teachers and all my friends who contributed to my personal and academic development up to this stage.

Last but not least in importance to me are my wife Kema and two children (Sivaram & Suvedini) without whose understanding, love and moral support, I could not have completed this thesis.
